Mr. Vincent Algar reports:

Initial Neomet test results show excellent recoveries from Gabanintha samples

West Perth, WA / January 9, 2018 / JMN Wire / **Australian Vanadium Limited** (ASX:AVL, "the Company" or "AVL") is pleased provide an update on recent and ongoing metallurgical test work on the Gabanintha Vanadium Project near Meekatharra in Western Australia.

NeoMet Polymetallic Metallurgical Process

As previously announced AVL has an engagement with Neomet and Sedgman to undertake a review of the behaviour of oxidised mineralisation from Gabanintha using the low cost, high polymetallic recovery, proprietary hydrometallurgical Neomet process (see AVL September 2017 Quarterly Activities Report).

Oxide TVM (titaniferous vanadiferous magnetite) ores generally show lower magnetic recovery to concentrate than transitional or fresh ore and therefore may not be as economic to process using a traditional pyrometallurgical process.

AVL is evaluating both traditional and non-traditional processing routes as it looks to maximise the value of its world class TVM resource at Gabanintha.

AVL sent core samples to be tested through a standard Neomet bench scale testing facility in their Montreal, Canada laboratory.

These initial tests were conducted free-of-charge to AVL. The proprietary process has previously demonstrated its ability to extract and recover over 95% of secondary metals at a commercial grade, with a metal purity of over 99.5%. The process potentially enables the extraction of V₂O₅, TiO₂ and Fe₃O₂ from TVM ores such as Gabanintha. The process seeks to generate maximum value of in-situ metal credits A unique closed HCl (hydrochloric acid) leaching circuit for acid regeneration and reuse/recycle is used in the process. AVL studies to date focused on initial magnetic concentration of its mineralised materials and processing of the concentrate using the technically mature pyrometallurgical process. Pyrometallurgical processes require ore concentrate to be roasted at ~850°C for 2 hours to release vanadium. Alternative, hydrometallurgical methods such as the Neomet process can be economically preferred substitutes in some situations, particularly when reagents such as acid can be efficiently recycled.

Initial test work focused on Gabanintha's high-grade and low-grade oxide ROM (run of mine) material.

LATEST JUNIOR MINING NEWS

Artemis Resources Reports First Cobalt/Copper/Gold JORC Resources at Carlow Castle Project

West Perth, WA / January 15, 2018 / JMN Wire / Artemis Resources Limited ("Artemis") (ASX: ARV) is pleased to provide the first of a number of JORC (2012) compliant resources with the Quod Est deposit at the Carlow Castle (Cobalt/Gold/Copper) Project, located about 20km south-east of Karratha in the Western Pilbara Region of Western Australia.
