

Australian Vanadium 强调了 Coates 镍铜铂族元素的前景

Australian Vanadium Ltd (ASX:AVL) 的土壤调查突出显示了含镍、铜和铂族元素 (PGE) 的岩石的预期序列, 这些岩石未经最近在 Coates 镁铁质侵入杂岩的 AVL 采矿权期间的勘探测试。

该公司正在其位于西澳大利亚珀斯东北 80 公里的 Wundowie 附近的 Coates 项目中勘探镍、贱金属、金和铂族元素。

值得注意的是, AVL 的 Coates 项目拥有一个钒钛磁铁矿矿床, 之前仅对钒钛矿化进行了勘探, 没有记录其他金属分析。

Australian Vanadium highlights Ni-Cu-PGE prospects at Coates

Australian Vanadium Ltd (ASX:AVL)'s soil survey has highlighted a prospective sequence of nickel, copper and platinum group elements (PGE)-bearing rock untested by recent exploration over the AVL tenure at the Coates Mafic Intrusive Complex.

The company is exploring nickel, base metals, gold, and PGEs at its Coates Project situated near Wundowie 80 kilometres northeast of Perth in Western Australia.

Notably, AVL's Coates Project hosts a vanadium-titanium magnetite deposit and was previously explored only for vanadium-titanium mineralisation, with no other metal assays recorded.
